

The research target: repair insertion without undoing earlier cable work

CURRENT: measured alignment test

6/6 guided seats vs 3/6 continued insertion.
No clip, snag, learned policy or recovery event.

NEXT: proposed clip-preserving recovery test

1 Fixed strain relief

Explicit boundary,
not an unplugging claim

2 Required open clip

Its physical release
counts as a failed task

3 Optional snag

Must have a feasible
robot-driven release

4 Seat while still held

Preserve clip and load limits.
Final release/latching is later.

**Question: when should the robot correct the plug,
and when must it free the cable first?**
