

Contact diagnostics and representative training capacity

Franka + FORGE simulation | Development measurements | 10 September 2026

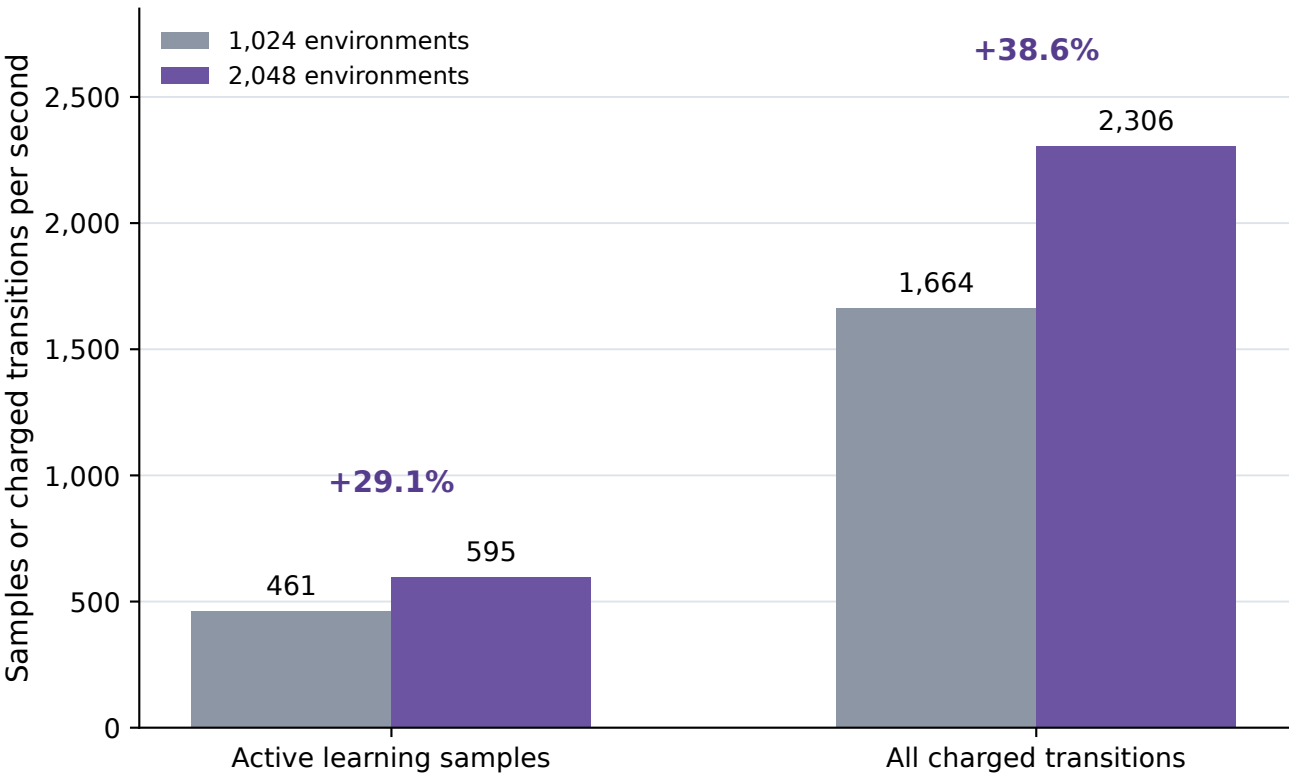

A Scripted insertion: first four seconds

All 28 requests at every point; native raw wrist abort stays at 20 N.
Survivors at 4 s are censored, not failed complete 30 s jobs.
Servo and reference changes are shared controller conditions.
Final reference pair: stability failed; active-request support failed.

The contact panel uses scripted actions throughout. No candidate policy controlled these prefixes.
The 20 mm/s limit applies to the Cartesian reference, not actual tool speed or a force ceiling.

B Training capacity, including startup

Timing includes initialization, PPO, diagnostics and checkpoint export.
Two cohorts per size; twice the charged work at 2,048 environments.
Unequal active samples: capacity only, not a learning-quality result.
